

DNS BlockList

For not long ago, [Microsoft owned Github chose to rename the terms "master" and "slave"](#) from its system as the said words are criticized for being racially insensitive. [GitHub's](#) move came amid ongoing protests against racism in the United States, after the death of African American George Floyd last May. [Li kewise, Apache's SpamAssassin made the same decision](#) about their black- and whitelisting system and renamed them to [welcomelist and blocklist](#). Tornevall Networks will, when upgrading the API's have the same approach.

```
#####
# Welcomelist rules
#
# Note that most of these get 'noautolearn'. They should not be
# considered when deciding whether to auto-learn a message, as a
# user slip-up could result in scribbling side-effects in the bays
# db as a result -- which is hard to remedy.
